1 Team & Roles

Team Name: Fitness Challenge App

Repository: <https://github.com/Inno-Fitness/Fitness-Challenge-App>

Name	Email	Responsibility (Week 5 Focus)
Ivan	i.lokhmotov@innopolis.university	Implementation of Google authentication, forgot password feature, bug fixes view view view
Kristina	kr.ushakova@innopolis.university	Add articles feed, onboarding tour and fix mobile modal layouts view view
Elvina	e.belorusova@innopolis.university	Articles search for the feed, camera page UX improvements
Daria	d.komzolova@innopolis.university	Admin panel logic implementation, streak bug fixes, writing tests view view view
Safina	s.mukhamedshina@innopolis.university	Deployment fixes, admin panel development. view view
Ekaterina	e.salazkina@innopolis.university	Camera page UX improvements, CV performance improvements, bug fixes
Anastasia	a.kalashnikova@innopolis.university	WowFit branding, Figma design for new implementation logic view
Timur	t.sagdeev@innopolis.university	Weekly deliverables, user feedback analysis

2 Project & Track Statement

Project: WowFit Challenges

Track: Industrial

2.1 Week 5 Goal

Turn the stakeholder feedback gathered during Week 4 into prioritized changes. Iterate on the product to improve UI/UX quality, expand authentication options, provide administrative tools, and resolve critical concurrency and time-synchronization bugs.

3 Feedback Analysis & Prioritization (PMs)

Based on the live demonstration and stakeholder review from the previous sprint, feedback was systematically analyzed and converted into actionable GitHub issues:

- **High Priority (Current Sprint):** Adding third-party login options (Google Auth), simplifying account recovery (forgot password), adding WowFit branding, and resolving core backend bugs related to streaks and data races.
- **Medium Priority (Current Sprint):** Developing an administrative dashboard to track basic user analytics, and deploying general frontend style improvements.
- **Backlog/Long-term:** Apple Health integration for step counts, virtual currency/gamification research, and advanced technical documentation for the CV model (later discovered to difficult too implement in the current state).

The backlog was reprioritized during our weekly planning meeting to ensure immediate user-facing blockers (like onboarding friction and streak miscalculations) were addressed first.

4 Iteration & Refinement

4.1 UI/UX Improvements & Feature Enhancements

- **Authentication & Access:** Implemented Google Authorization to provide users with a seamless third-party login option. Additionally, introduced a 'Forgot Password' feature to simplify the

account recovery process.

- **Administrative Tools:** Developed and deployed a foundational Admin Panel designed to provide stakeholders with crucial analytics and basic information regarding user engagement. The access link is in the "Links" section of the report.
- **Frontend:** Integrated the official WowFit corporate logo into the frontend interface, added article feed, alongside a series of other global style improvements to enhance overall visual consistency and polish.

4.2 Application Stability & Bug Fixes

- **Concurrency Optimization:** Fixed a critical lost-update race condition within the `submit()` function by implementing robust row locking, ensuring data integrity during simultaneous exercise submissions.
- **Timezone & Streak Accuracy:** Patched the `PATCH /me` endpoint to correctly accept and process local user timezones. Furthermore, updated the system logic to dynamically recompute user streaks directly on read, guaranteeing accurate display for users across different regions.

5 Track-Specific Refinement (Industrial)

To ensure the improvements made to the backend are non-trivial and reproducible, we measured the system against our Week 4 baseline:

- **Data Integrity:** The introduction of row locking in the `submit()` function successfully eliminated 100% of simulated lost-update race conditions during high-load concurrency testing.
- **API Reliability:** Dynamic streak recomputation on read, combined with the new timezone patching, passed all localized edge-case tests without increasing the API response time beyond our 200ms threshold.
- **Reproducibility:** All backend and UI optimizations were merged with updated unit tests, maintaining our 95% code coverage standard and automatically passing the GitHub Actions CI pipeline.
Check the test results [here](#), to see them properly, download the .html file and open it in your browser. The backend tests can be found [here](#)
